## SUMMARY

Computer Science student who enjoys solving practical problems and building software that works closely with hardware. Strong problem-solving skills developed through competitive programming, technical projects, and hands-on software development, with a curious mindset and collaborative approach to learning.

## EDUCATION

**Bachelor of Science in Computer Science**

**September 2023 - Present**

**University of Calgary - Calgary, Alberta**

- **GPA: 3.84/4.0**
- **Courses:** Computer Architecture, Computer Networks, DSA, Operating Systems, Database Systems, Cybersecurity
- **Awards:** Dean's List 2024, 2025 & 2026, International Undergraduate Award, Winner - Programming Contest 2026

## TECHNICAL SKILLS

**Languages:** C, C++, Python, Java, SQL, JavaScript, TypeScript

**Tools & Technologies:** Git, Linux, Docker, Kubernetes, PostgreSQL, PyTorch, scikit-learn, React, React Native, Node.js

## EXPERIENCE

**Software Engineering Intern | Hutton Safety Group**

**May 2026 - August 2026**

- Developing a client-facing safety management platform using Python, PostgreSQL, and REST APIs, consolidating 60+ client-specific systems into one centralized system.
- Built computer vision workflows to transcribe paper safety forms and map extracted information to existing database records for digitized form processing.
- Automated form routing, escalation alerts, and status updates, reducing process completion time by ~70%.

**Full Stack Developer | TechStart**

**September 2025 - Present**

- Developing Sterling, a production budgeting and analytics application using React Native, TypeScript, PostgreSQL, AWS Amplify, and Supabase, supporting more than 50 beta users.
- Built a PyTorch-based AI finance assistant trained to analyze user spending patterns and generate personalized budgeting insights, alerts, and reminders.
- Improved application performance by ~40% through optimized data fetching, query design, and state management.

## PROJECTS

**PerfectTemp - Distributed Smart Thermostat | C, ESP32, FreeRTOS, ESP-NOW, Embedded Control, I<sup>2</sup>C**

- Built a distributed thermostat for a six-bedroom home, using room sensor nodes to reduce disagreements over centralized heating by accounting for each room's preferred temperature.
- Programmed sensor nodes in C using FreeRTOS to handle temperature monitoring and wireless communication.
- Used ESP-NOW and I<sup>2</sup>C to connect devices and sensors, with separate components for sensing and heating control.

**Healo - Clinic Management App | PERN Stack, Figma, HCI, scikit-learn**

- Designed and built a patient appointment and records system emphasizing accessibility and workflow clarity.
- Trained a Naive Bayes booking-intent model on 1000+ synthetic request samples, achieving 92% accuracy.
- Conducted user interviews across 20 clinics to validate workflows through iterative testing and feedback.

**Bnbnets - Rental Booking Platform | JavaScript, Node.js, React, SQL, Docker, Kubernetes, Stripe**

- Built a full-stack booking platform with search, filtering, authentication, real-time bookings, and chat features.
- Designed relational schemas and wrote optimized SQL queries for availability checks, waitlists, penalties, and transaction-safe payment workflows and managed containerized environments using Docker and Kubernetes

## ADDITIONAL LEADERSHIP & INVOLVEMENT

**President – Competitive Programming Club:** Leading club operations, weekly workshops, contest preparation, and a student team delivering two annual programming events for 200+ participants.
